

# AceAge Selects Applied Recognition to Provide Face Recognition Technology for Biometric Identity Authentication

*Applied Recognition's technology will add biometric patient verification to AceAge's medication delivery solution, Karie™*

**TORONTO | May 23, 2018** - [AceAge](#), the maker of the automated medication delivery appliance [Karie](#), has selected [Applied Recognition](#)'s Ver-ID technology to incorporate face recognition in their solution, making *Karie* more secure and user-friendly.

"It was a natural decision to add Applied Recognition's technology to our flagship product," says Spencer Waugh, CEO of AceAge. "Ver-ID is fast, accurate and unique in its ability to run without any impact on our monthly data requirements. Now, our end users can dispense their prescriptions at a glance and without worry that, for example, a child might inadvertently get access. Our partners understand that better adherence will both lower healthcare costs and improve health outcomes, as well as bring security to medication in peoples homes."

Ver-ID is Applied Recognition's line of software development kits which make it easy to add facial recognition capabilities to digital business processes. Ver-ID technology is distinctive in achieving high levels of accuracy and speed while able to run entirely on mobile devices, IoT appliances or 'in the cloud.' This enables the use of face recognition in use cases where it would otherwise be impractical.

"We're proud that Ver-ID will be used to help people improve their health outcomes," said Ray Ganong, Applied Recognition's Co-CEO. "*Karie* fixes the very real problem of drug non-adherence and does so elegantly. Everything is designed for simplicity, from how the medication is loaded through to the caregiver alert feature if a dosage is missed by the patient. This appliance should be used in every household where medication is being taken for a chronic condition."

AceAge also anticipates that adding face recognition is going to further contribute to making *Karie* a must-have for management of late-stage clinical trials where strong documentation of adherence is essential. The face recognition feature will also allow users to digitally sign electronic medication adherence records. Set to be commercially available later this year, *Karie* schedules, monitors and delivers medication for its users; leaving no room for human error. *Karie* improves health outcomes, enables older individuals to age in place and relieves caregivers from the task of medication management.

**About Applied Recognition**

APPLIED RECOGNITION INC. is a leader in face detection, recognition and authentication technology. Founded in 2005, Applied Recognition has developed an extensive portfolio of patents for facial recognition & indexing, and for enterprise-grade, biometric authentication technologies.

Applied Recognition serves organizations that rely on biometrics to improve performance and security: financial services providers, IoT device manufacturers, and leading software publishers. Licensing is available for software development kits for the Android and iOS platforms to support online identity verification and digital signature applications as well as for login/authentication use cases. ARI also offers Ver-ID Face Authenticator, enabling the addition of second-factor authentication to any enterprise IT access-control system.
